Proven by time

Concept of Action

Nedaps\_IDM security

System

About us

WASKO Capital Group

# Concept of Action:

## Task system

The task of NEDAPS\_IDM is to automate and unify the policy management process security. In particular, the solution ensures the management (granting, modifying, withdrawing) of the rights of employees and guests to the company's internal systems or institution. The system provides integration with IT systems and devices using available interfaces. NEDAPS\_IDM reflects the organizational structure of the enterprise or institution. For this purpose, the system enables integration with directory services systems

## We take into account the needs of our customers

The system is based on models built for individual services taking into account the specificity of the integrated systems. These models can be created, modified and launched by the client. Thus, the client is able to adapt the system to his needs in a completely independent way.

## Applications

The effect of using NEDAPS\_IDM system is to optimize service time, reduce the number of administrators involved, standardize the assigned rights, increase security and ensure data integrity.

## NEDAPS\_IDM System:

It unifies and automates the management of employee rights,

unifies security policy,

reduces the involvement of highly qualified specialists in the process of managing employee rights,

It definitely speeds up the process of rights management.

## NEDAPS\_IDM Features:

01

possibility of integration with any system in terms of the interface provided by this system,

02

no need to install agents for integrated systems,

03

full monitoring of operations performed,

04

possibility to perform batch operations,

05

self-expansion by the system is designed to provide the customer with service models and thus the functionality of the system.

# Nedaps\_IDM security

NEDAPS\_IDM  
increases the level of  
information and  
communication  
security of a  
company through:

**supporting the protection of applications and data** against unauthorized access,

**preventing dangerous situations of absence** the correlation between the employee's role in the company and the scope of his or her rights,

**preventing errors** in the granting of rights, in particular leaving the rights redundant workers,

**control of the powers granted and possibilities** verification of the company's security policies related to access to systems,

**enable cooperation with other systems** the safety of the system (e.g. SIEM).

## System

A flexible solution that allows you to automate any activities (processes, configurations, communication with devices and systems) in a fast and efficient way. The idea of operation NEDAPS is about creating a model of operation. The system is subject to automation and can be made available to users, who can be both individuals and systems.
